General practitioners (GP) home management guidelines for COVID-19 patients: Guidelines
Aisha Ambreen1, Tabinda Ashfaq2, Marie Andrades3, Fauzia Akhtar4, Sadaf Badiuzzaman5, Lubna Baig6

Abstract
Carefully developed guidelines for clinical practice serve as an important tool for desirable changes in health care of a country. They act as an important source of information for physicians as well as policy makers and educational institutions thereby improving the quality of care of patients. The outbreak of Novel Coronavirus Disease (COVID-19) in 2019 has placed a huge burden on health care system globally. The first line health care provider bears the brunt of this disease with limited and varying sources of information as most of the patients present to them. Varied presentation of disease along with limited hospital facilities for admission is a huge challenge for appropriate management and referral of these patients. These guidelines, prepared after reviewing the interim guidelines in literature, will serve as a source of guidance for GPs to manage mild cases at home and refer those with moderate and severe disease to tertiary care hospitals.

Keywords: COVID-19, General Practitioner, Guideline, Home visit

DOI: https://doi.org/10.47391/JPMA.1526

Introduction
The outbreak of COVID-19 caused by SARS-CoV-2 virus has progressed to the status of a global pandemic, with so many countries adversely affected across all seven continents. The number of cases has approached over 93 million with over 2 million deaths (January 2021).1 This has created a huge burden on health care system. Most of the patients presenting with COVID 19 have mild symptoms which can be managed at home while those with severe or critical disease should be referred to a tertiary care hospital for further management.2

General Practitioners (GPs) act as the frontline force in managing common problems in the community. The amount of rapidly changing information circulating on social media related to COVID 19 is overwhelming and is a cause of confusion and anxiety in primary health care providers.3 A number of interim guidelines on surveillance and management of this infection2,4,5 have been published by several public health stakeholders. The following evidence based rapid guidelines have been specifically prepared for general practitioners of Pakistan on home management of confirmed COVID-19 patients (Table 1) as a quick reference guide.

Clinical Features: COVID-19 presents with variable symptoms ranging from non-severe to critical disease. These symptoms can appear anytime within 2-14 days after exposure to the virus.

Symptoms4 may include

- Fever with or without chills (83–99%)
- Cough (59–82%)
- Anorexia (40–84%)
- Fatigue (44–70%)
- Loss of smell or taste (65%)
- Difficulty in breathing (31–40%)
- Myalgias (11–35%)
- Headache <10%
- Sore throat <10%
- Runny nose/Congestion <10%
- Nausea/Vomiting <10%
- Diarrhoea <10%

Atypical presentations6: Can occur in immune-compromised or older patients

- Fall
- Delirium/confusion
- Syncope
- Functional decline
- Reduced mobility
- Bacterial co-infections
- Absence of fever

Testing criteria: All patients who present with fever, respiratory symptoms alone or in combination with any of specified symptoms should get tested for COVID-19. The
types of tests currently recommended and available in Pakistan are summarized in Table 2.

**Home Management of COVID:** The current COVID-19 situation is posing challenges to patients, their families as well as the doctors alike with high risk of infection transmission. In addition informed patients are reluctant to visit hospitals at this time due to fear of acquiring the infection. GPs being on the frontline are faced with the greatest threat of acquiring infection thus they are required to follow standard precautions for every patient they are taking care of at home as well as in clinics. Keeping this in mind, the following measures and recommendations have been proposed for GPs on infection control with particular emphasis on home management.

**Standard Precautions for GPs:**
- Rigorous hand washing and hygiene
- Appropriate use of personal protective equipment (PPE)
- Needle-stick injuries prevention
- Safe management and disposal of waste
- Equipment disinfection and cleaning
- Environment cleaning
- Maintaining safe distance from patients and examination only if necessary with full PPE

**Infection control measures to be followed by GPs during home visits:**
- Use of PPE is mandatory before entering the house. A new gown, gloves and surgical cap should be used as per donning procedure for each home visit if visiting multiple houses to prevent infections.
- Avoid unnecessary touching of surfaces or eating/drinking during consultation at patient’s house.
- After leaving the patient’s house and before entering your car/transport, PPE should be removed as per doffing procedure and hand hygiene should be performed.

### Table 4: Specific Symptom Based Management of Mild Disease.

#### Fever & bodyaches:
**General measures:**
- Advise regular temperature charting. Fever may persist for over a week and can be biphasic.

**Medications:**
- Advise to take Tab Paracetamol if fever > 38°C degrees or having bodyaches. NSAIDs can be given.

#### Runny nose:
**General measures:**
- Advise to use a tissue to cover mouth and nose while coughing and sneezing and discard appropriately after use.

**Medication:**
- Advise to use Antihistamines if required

#### Breathlessness:
**General measures:**
- Advise to check oxygen saturation with pulse oximeter q4-6 hourly. Also check after 5 min walk. (normal 95%)
- Advise patients who are self-isolating alone to open a window if facing outside the house, to improve air circulation
- Advise to encourage positioning and breathing techniques
  - Sitting upright, leaning forward with arms bracing a chair and upper body supported
  - Relaxing and dropping shoulders
  - Pursed breathing (inhale through nose for several seconds with mouth closed and then exhale slowly through pursed lips for 4-6 seconds)

**Medication:**
- Advise honey/lozenges
- Advise to avoid lying on back as it makes coughing ineffective. Preferably lie in prone position or sideways

#### Cough:
**General measures:**
- Advise to transfer patient to nearby emergency in case of oxygen saturation dropping below <94%
- While waiting for ambulance if oxygen is available consider a trial of oxygen therapy

**Medications:**
- For dry cough: Cough syrup containing Codeine compound every 6 hours
- For productive cough: cough syrup containing dextromethorphan compound

**Warning:** Keep an eye on elderly, frail, those with co morbidities (diabetes, asthma etc) or reduced ability to cough and clear secretions as they are more likely to develop pneumonia Steam inhalation and nebulization are aerosol generating procedures and facilitate the spread of virus so caution must be exercised.

In patients with COPD and bronchiectasis avoid using cough suppressants as it can lead to sputum retention.

### Table 5: Evidence of therapeutic and adjunctive COVID-19 medications.

<tbody>
<tr>
<td>2.</td>
<td>Hydroxy-chloroquine and Chloroquine</td>
<td>Antimalarial</td>
<td>Data shows no clinical benefit in hospitalized patients&lt;sup&gt;4&lt;/sup&gt;</td>
<td>For prophylaxis: Not recommended for prevention of COVID-19 infection&lt;sup&gt;7,8&lt;/sup&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>No reductions in 28-day mortality, associated with an increased length of hospital stay and increased risk of progressing to invasive mechanical ventilation or death&lt;sup&gt;8&lt;/sup&gt;</td>
<td>For treatment: Not recommended for treatment of COVID-19 infection&lt;sup&gt;7,8&lt;/sup&gt;</td>
</tr>
<tr>
<td>3.</td>
<td>Azithromycin</td>
<td>Antibiotic (Macrolide)</td>
<td>Data shows no clinical benefit in hospitalized patients&lt;sup&gt;4&lt;/sup&gt;</td>
<td>For treatment: Not recommended&lt;sup&gt;7&lt;/sup&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>No clinical benefit with use in patients hospitalized with COVID-19. Use should be restricted to patients where there is a clear antimicrobial indication&lt;sup&gt;7&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>QT prolongation seen when used in combination in high risk patients&lt;sup&gt;6&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>Corticosteroids</td>
<td>Anti-inflammatory drug</td>
<td>Steroids have demonstrated a mortality reduction of 8.7% and 6.7% in severe and critical patients with COVID-19&lt;sup&gt;2,8&lt;/sup&gt;</td>
<td>For treatment: Steroid use recommended to patients with severe or critical disease who need supplemental O&lt;sub&gt;2&lt;/sub&gt;&lt;sup&gt;2&lt;/sup&gt; Use in non-severe patients may lead to an increase in mortality and should be avoided&lt;sup&gt;7&lt;/sup&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Choice of drug at discretion of clinician&lt;sup&gt;2&lt;/sup&gt; (Dexamethasone is cheaper, easier to use in outpatient setting, and has more potent anti-inflammatory activity)</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>Zinc</td>
<td>Essential Mineral</td>
<td>Possesses direct and indirect antiviral properties with suppression of inflammatory reaction&lt;sup&gt;5&lt;/sup&gt; Insufficient data to recommend either for or against the use of zinc for the treatment of COVID-19&lt;sup&gt;7&lt;/sup&gt;</td>
<td>For treatment: Not recommended for use above the recommended dietary allowance for the prevention of COVID-19 except in a clinical trial&lt;sup&gt;7&lt;/sup&gt;</td>
</tr>
<tr>
<td>6.</td>
<td>Ascorbic acid</td>
<td>Multivitamin</td>
<td>Has potent antioxidant and immunomodulatory properties Insufficient data to recommend either for or against the use of Vitamin C for the treatment of COVID-19&lt;sup&gt;2&lt;/sup&gt;</td>
<td>For prophylaxis: No recommendations available yet Potential role being evaluated due to its antioxidant with immune-modulatory properties&lt;sup&gt;4&lt;/sup&gt;</td>
</tr>
<tr>
<td>7.</td>
<td>Vitamin D</td>
<td>Multivitamin</td>
<td>Has an immunomodulation role, increases innate immunity by secretion of antiviral peptides which improves mucosal defenses&lt;sup&gt;16&lt;/sup&gt; Some recent studies show an association between vitamin D and Covid-19 severity and mortality&lt;sup&gt;11&lt;/sup&gt;</td>
<td>For treatment: Insufficient data to recommend either for or against the use of vitamin D for the prevention or treatment of COVID-19&lt;sup&gt;7&lt;/sup&gt; Potential role being evaluated as an immune-modulatory effect&lt;sup&gt;11&lt;/sup&gt;.</td>
</tr>
</tbody>
</table>

• Used PPE should be sealed in a plastic bag and disposed off or washed for reuse where applicable.
• All the used instruments should be disinfected using a disinfectant containing 70% Alcohol
• On reaching home, shower is advised before meeting and greeting any household members

Table 3 provides an approach to the diagnosis and management of COVID-19 patients. The severity criteria have been adopted from already published guidelines by World Health Organization, Center of Disease Control and recently updated guidelines of National Institute of Health (NIH) Pakistan.2,4-6

**Symptom based management of mild disease:** Our guidelines focus on management of non-severe clinical presentation of COVID. Most of the patients recover and can be managed at home, however the risk of hospitalization should not be ignored, therefore frequent and efficient monitoring is essential. The decision to shift the patient to an inpatient setup should be made on a case to case basis. This decision depends not only on the clinical presentation but additionally on potential risk factors for severe disease, the ability of the patient to self-isolate at home or any requirement for supportive care. Patients at high risk of complication for severe illness should be monitored closely because of the risk of progression to severe illness, specially seen in the second week after symptom onset. Strict watchfulness is mandatory at home as some may develop severe disease even earlier.

Enhancing the body’s immunity plays an important role in maintaining optimum health. Following general measures should be ensured at home and suggested to the patients.

**General measures:** Advice patients to

- Stay at home in a well-ventilated room
- Eat healthy meals and keep well hydrated
- Get plenty of rest and sleep
- Get involved in physical activity as tolerated
- Encourage mental relaxation techniques to help cope with anxiety and panic
- Keep a pulse oximeter at home if possible and stay vigilant in case the oxygen saturation drops and stays below 95% as this may require hospital admission

Table 4 highlights a brief management plan for the commonly reported symptoms at home. To date, there is no specifically approved treatment for COVID-19 i.e. no cure yet, although various treatments are currently under investigations and trials.

Table 5 shows the evidence based recommendation for the various therapeutic and adjunctive treatments being investigated and tested.

**Home visit advice by GPs for mild category COVID-19 patients**

**Advice given by GPs for self-isolating COVID-19 patients at home**

- Patient should be quarantined in a well-ventilated single room with limited movement. Ideally, they should have access to a separate toilet else it should be disinfected after every use.
- Patient should be advised to wear a surgical mask to prevent contamination especially during care giver presence in the room or when leaving room for any reason.
- Separate eating utensils should be advised for patient; and after use these should be washed with soap and water by the patient him/herself if stable otherwise by
care given with all precautions.

- Surfaces which are frequently touched like tables, door handles and any other bedroom furniture should be disinfected daily using any household disinfectant that contains 0.1% sodium hypochlorite (equivalent to 1000 ppm).
- All clothes, bed linen, towels under patient use, should be either washed with laundry soap and water or it can be machine washed at 60–90 °C (140–194 °F) using household detergent.
- Patients should limit contact with others through social distancing.

Advice given by GPs for caregivers of COVID-19 patients at home

- Household members should be advised to stay in a separate room from the patient. If this is not possible, then a minimum distance of at least 2 meter (6 feet) should be maintained. Ideally patient should be advised to use a separate washroom. If not possible then disinfect toilet after every use.
- The number of caregivers should be limited. Ideally, assign one person who is in good health and has no medical problems.
- Caregivers should at least wear a surgical mask and gloves when with the patient. Mask handling should be minimized during use. If it gets wet from secretions, replace immediately with a new and dry mask using appropriate technique (Avoid touching the front of mask). Mask and gloves should be discarded in a closed container immediately after use and hand hygiene carried out.
- Avoid coming in contact with patient’s skin, clothes or any other contaminated materials. Perform hand hygiene after handling all items.
- Visitors should not be allowed until patient’s complete recovery and all signs or symptoms of COVID-19 have resolved.
- Care giver should perform hand hygiene after any contact with patients or their environment or use an alcohol-based hand rub if hands cannot be washed.
- Those who cannot tolerate a mask should be advised to use rigorous respiratory hygiene; They should cover their mouth and nose with a disposable paper tissue on coughing or sneezing which should be discarded after use.
- Gloves, masks, and other waste should be placed into a waste bin with a lid before disposing off.
- Avoid other types of exposure to all items from immediate environment of patient (like toothbrushes, dishes and utensils, towels or bed linen etc.).

Conclusion

These guidelines will assist as a resource for GPs to differentiate the different categories of COVID-19 according to severity. Additionally, this will serve as a guide for appropriate home management of non-severe disease, appropriately identifying and referring those with severe or critical disease thereby easing the burden on tertiary care hospital.
